# Final Project

First report due on March 31, 2022

Introduction

The final project requires you to use everything you have learnt to produce a data pipeline for your selected dataset. Thus, we have the following steps

1. Select a problem together with its data set to be loaded in the Mariadb database.

2. Generate a Pipeline using

   (a) MLflow to track changes of performance in your pipeline

   (b) Hydra to work your hyper-parameters

3. Then you would have the following pipeline

4. All your algorithms need to be implemented in Jax for your final reports.
